- What are tokens? Words or characters?
- What are your representations?

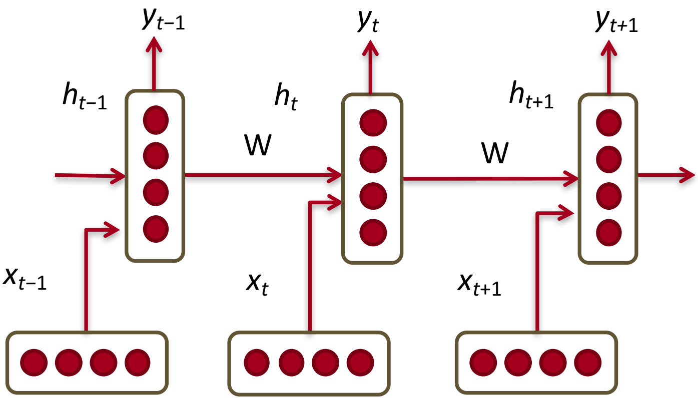
Recurrent Neural Networks



- Condition on all previous words
- Hidden state at each time step

Hidden State by Fiat

- $h_{t,1}$ is the total number of positive sentiment words seen by time t
- $h_{t,2}$ is the total number of negative sentiment words seen by time t
- y_t is the number of positive sentiment words minus negative sentiment words

RNN parameters (abstract)

$$h_t = f(\mathbf{W}^{(hh)}\vec{h}_{t-1} + \mathbf{W}^{(hx)}\vec{x}_t + \vec{b}^{(h)}) \quad (4)$$

$$\hat{y}_t = W^{(S)} h_t \quad (5)$$

$$(6)$$

- Learn parameter h_0 to initialize hidden layer
- x_t is representation of input (e.g., word embedding)
- $\hat{y}$ is the output (in our example, sentiment)

Basic RNN parameters (concrete)

Dimension of x and h are both 2 (positive and negative)

$$\mathbf{W}^{(hh)} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \tag{7}$$

$$\mathbf{W}^{(hx)} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \tag{8}$$

$$\vec{b}^{(h)} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \tag{9}$$
