

Department of Computer Science
UNIVERSITY OF COLORADO **BOULDER**

Machine Learning: Jordan Boyd-Graber
University of Colorado Boulder
LECTURE 1A

Slides adapted from Lauren Hannah and Dave Blei

Roadmap

- What machine learning is
- What machine learning can do
- What the course is about

Outline

Data are everywhere.

Dear Beloved,

My name is Mrs. Susan Polla, from ITALY. If you are a christian and interested in charity please reply me at : (s.polla@yahoo.fr) for insight.

Respectfully,

Mrs Susan Polla.

How about this one?

Subject: Superbowl?

Date: January 28, 2013 8:09:00 PM EST

To: jbg@umiacs.umd.edu, [snipped]

Anyone interested in coming by to watch the game? Beer and pizza, I'd imagine. Should be an exciting game!

Where are the faces?

Data contain patterns
that can help us solve problems.

This Course (Digging into Data)

We will study algorithms that find and exploit patterns in data.

- These algorithms draw on ideas from statistics and machine learning.
- Applications include
 - natural science (e.g., genomics, neuroscience)
 - web technology (e.g., Google, NetFlix)
 - finance (e.g., stock prediction)
 - policy (e.g., predicting what intervention X will do)
 - and many others

This Course (Digging into Data)

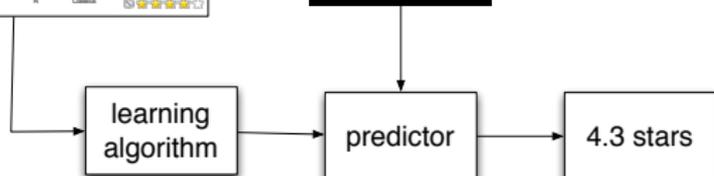

We will study algorithms that find and exploit patterns in data.

- Goal: fluency in thinking about modern data analysis problems.
- We will learn about a suite of tools in modern data analysis.
 - When to use them
 - The assumptions they make about data
 - Their capabilities, and their limitations
 - Theoretical guarantees
- We will learn a language and process for solving data analysis problems. On completing the course, you will be able to learn about a new tool, apply it data, and understand the meaning of the result.

Basic idea behind everything we will study

- 1 Collect or happen upon data.
- 2 Analyze it to find patterns.
- 3 Use those patterns to do something.

Outline

How the ideas are organized

Of course, there is no one way to organize such a broad subject. These concepts will recur through the course:

- Probabilistic foundations
- Supervised learning (more of this)
- Unsupervised learning (less of this)
- Methods that operate on discrete data (more of this)
- Methods that operate on continuous data (less of this)
- Representing data / feature engineering
- Evaluating models
- Understanding the assumptions behind the methods

Supervised vs. unsupervised methods

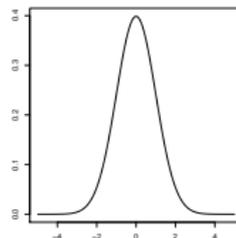

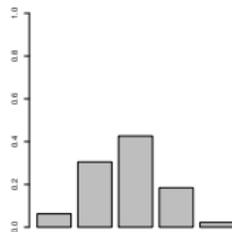

- **Supervised methods** find patterns in **fully observed** data and then try to predict something from **partially observed** data.
- For example, we might observe a collection of emails that are categorized into *spam* and *not spam*.
- After learning something about them, we want to take new email and automatically categorize it.

Supervised vs. unsupervised methods

- **Unsupervised methods** find **hidden structure** in data, structure that we can never formally observe.
- E.g., a museum has images of their collection that they want grouped by similarity into 15 groups.
- Unsupervised learning is more difficult to evaluate than supervised learning. But, these kinds of methods are widely used.

Discrete vs. continuous methods

- Discrete methods manipulate a finite set of objects
 - e.g., classification into one of 5 categories.
- Continuous methods manipulate continuous values
 - e.g., prediction of the change of a stock price.

One useful grouping

	<i>discrete</i>	<i>continuous</i>
<i>supervised</i>	classification	regression
<i>unsupervised</i>	clustering	dimensionality reduction

One useful grouping

	<i>discrete</i>	<i>continuous</i>
<i>supervised</i>	classification	regression
<i>unsupervised</i>	clustering	dimensionality reduction

Classification

SVM, naïve Bayes, logistic regression, boosting

One useful grouping

	<i>discrete</i>	<i>continuous</i>
<i>supervised</i>	classification	regression
<i>unsupervised</i>	clustering	dimensionality reduction

Clustering

k-means, latent Dirichlet allocation

One useful grouping

	<i>discrete</i>	<i>continuous</i>
<i>supervised</i>	classification	regression
<i>unsupervised</i>	clustering	dimensionality reduction

Regression

Linear Regression, Ridge Regression, Lasso

One useful grouping

	<i>discrete</i>	<i>continuous</i>
<i>supervised</i>	classification	regression
<i>unsupervised</i>	clustering	dimensionality reduction

Dimensionality Reduction

...

One useful grouping

	<i>discrete</i>	<i>continuous</i>
<i>supervised</i>	classification	regression
<i>unsupervised</i>	clustering	dimensionality reduction

Other

Reinforcement Learning, Ranking, Structured Prediction

Data representation

→ $\langle 1.5, 3.2, -5.1, \dots, 4.2 \rangle$

Republican nominee George Bush said he felt nervous as he voted today in his adopted home state of Texas, where he ended...

→ $\langle 1, 0, 0, 0, 5, 0, 9, 3, 1, \dots, 0 \rangle$

→
$$\begin{bmatrix} 1 & 0 & 1 & \dots & 0 \\ 0 & 1 & 1 & \dots & 0 \\ 1 & 0 & 0 & \dots & 1 \\ \dots & & & & \\ 0 & 0 & 0 & \dots & 0 \end{bmatrix}$$

Understanding assumptions

- The methods we'll study make **assumptions** about the data on which they are applied. E.g.,
 - Documents can be analyzed as a sequence of words;
 - or, as a “bag” of words.
 - Independent of each other;
 - or, as connected to each other
- What are the assumptions behind the methods?
- When/why are they appropriate?
- Much of this is an art

Outline

A Simple Example

- Suppose you're a big company monitoring the web
- Someone says something about your product (x)
- You want to know whether they're positive ($y = +1$) or negative ($y = -1$)

Our (Usual) Assumption

- We have **training** examples $\{x_1, y_1\} \dots \{x_N, y_N\}$
- We have an unknown **test** example x without y
- What do we predict $h(x)$?

A simple solution

- Find something similar

A simple solution

- Find something similar

Discrete

$$d(x_1, x_2) = 1 - \frac{|x_1 \cap x_2|}{|x_1 \cup x_2|} \quad (1)$$

Continuous

$$d(x_1, x_2) = (\vec{x}_1 - \vec{x}_2)^2 \quad (2)$$

A simple solution

- Find something similar

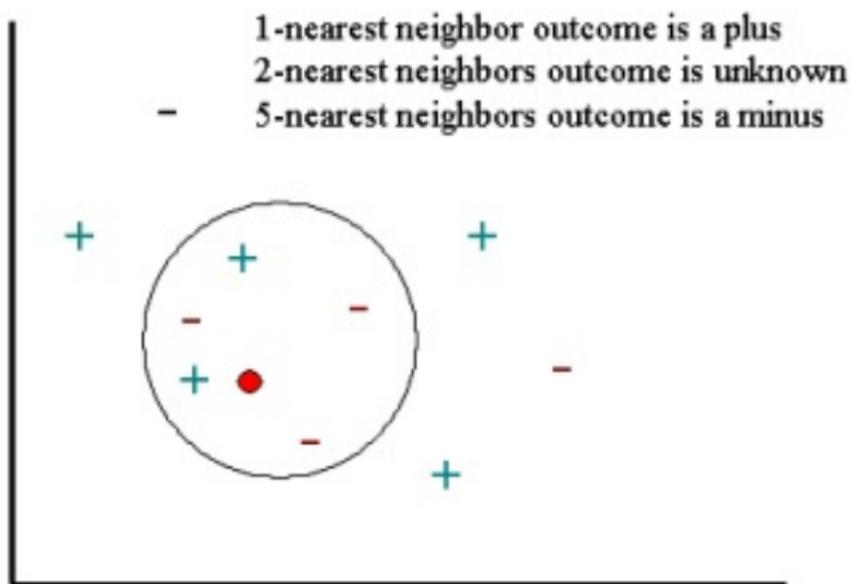

Discrete

$$d(x_1, x_2) = 1 - \frac{|x_1 \cap x_2|}{|x_1 \cup x_2|} \quad (1)$$

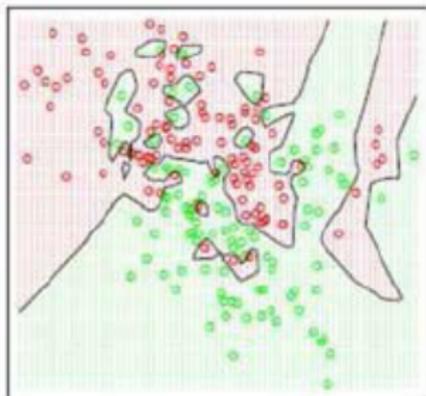

Continuous

$$d(x_1, x_2) = (\vec{x}_1 - \vec{x}_2)^2 \quad (2)$$

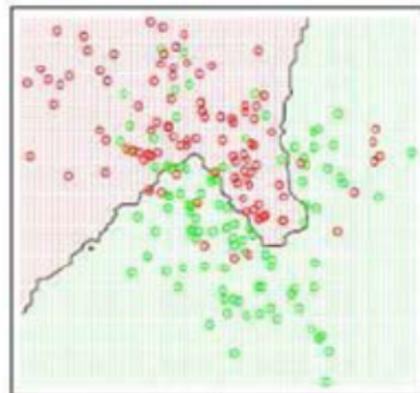

- We can do better ... look for the k closest and return the average y

K=1

K=15

First Homework

- Implement *k*-nearest neighbors
- Acclimate you to the Python programming environment
- Introduce you to using Moodle to submit assignments

Outline

A statistician's manifesto

(From T. Hastie, via J. McAuliffe)

- Understand the ideas behind the statistical methods, so you know how to use them, when to use them, when *not* to use them.
- Complicated methods build on simple methods. Understand simple methods first.
- The results of a method are of little use without an assessment of how well or poorly it is doing.

Next time ...

- *Probabilities*
- Learning from data
 - Naïve Bayes
 - Logistic Regression
