

## Multiclass

Jordan Boyd-Graber  
University of Colorado Boulder  
LECTURE 13

Slides adapted from Rob Schapire and Fei Xia

## Motivation

---

- Binary and Multi-class: problems and classifiers
- Solving Multi-class problems with binary classifiers
  - One-vs-all
  - All pairs
  - Error correcting codes

## Classification Problems

---

- Natural binary
  - Spam classification (spam vs. ham)
  - Segmentation (same or different)
  - Coreference

## Classification Problems

---

- Natural binary
  - Spam classification (spam vs. ham)
  - Segmentation (same or different)
  - Coreference
- However, many are multiclass
  - Topic classification
  - Part of speech tagging
  - Scene classification

## Classifiers

---

- Some are directly multi-class (naïve Bayes, logistic regression, KNN)
- Other classifiers are basically binary

## Classifiers

---

- Some are directly multi-class (naïve Bayes, logistic regression, KNN)
- Other classifiers are basically binary
  - SVM
  - Perceptron
  - Boosting

## Reduction

---

### Multiclass Data

`<name=Cindy , age=5 , sex=F>`,   
`<name=Marcia, age=15, sex=F>`,   
`<name=Bobby , age=6 , sex=M>`,   
`<name=Jan , age=12, sex=F>`,   
`<name=Peter , age=13, sex=M>`, 

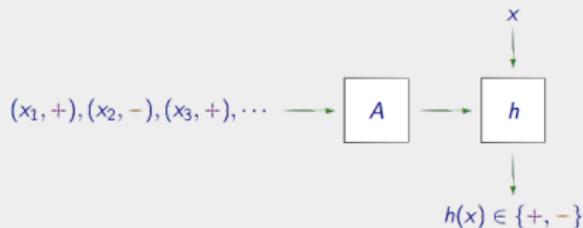

## Reduction

---

### Multiclass Data

$\langle \text{name=Cindy , age=5 , sex=F} \rangle$ , ■  
 $\langle \text{name=Marcia , age=15 , sex=F} \rangle$ , ■  
 $\langle \text{name=Bobby , age=6 , sex=M} \rangle$ , ■  
 $\langle \text{name=Jan , age=12 , sex=F} \rangle$ , ■  
 $\langle \text{name=Peter , age=13 , sex=M} \rangle$ , ■

### Binary Classifier

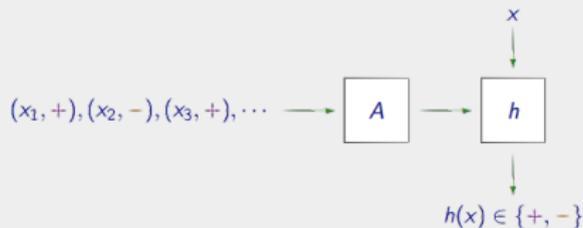

## Reduction

---

### Multiclass Data

$\langle \text{name=Cindy , age=5 , sex=F} \rangle$ , ■  
 $\langle \text{name=Marcia , age=15 , sex=F} \rangle$ , ■  
 $\langle \text{name=Bobby , age=6 , sex=M} \rangle$ , ■  
 $\langle \text{name=Jan , age=12 , sex=F} \rangle$ , ■  
 $\langle \text{name=Peter , age=13 , sex=M} \rangle$ , ■

### Binary Classifier

Goal: Multiclass Classifier

## One-Against-All

		■	■	■	■
$x_1$	■	$x_1$ -	$x_1$ +	$x_1$ -	$x_1$ -
$x_2$	■	$x_2$ -	$x_2$ -	$x_2$ +	$x_2$ -
$x_3$	■	$x_3$ -	$x_3$ -	$x_3$ -	$x_3$ +
$x_4$	■	$x_4$ -	$x_4$ +	$x_4$ -	$x_4$ -
$x_5$	■	$x_5$ +	$x_5$ -	$x_5$ -	$x_5$ -
		⇓	⇓	⇓	⇓
		$h_1$	$h_2$	$h_3$	$h_4$

- Break  $k$ -class problem into  $k$  binary problems and solve separately
- Combine predictions: evaluate all  $h$ 's, hope exactly one is + (otherwise, take highest confidence)

## One-Against-All

		■	■	■	■
$x_1$	■	$x_1$ -	$x_1$ +	$x_1$ -	$x_1$ -
$x_2$	■	$x_2$ -	$x_2$ -	$x_2$ +	$x_2$ -
$x_3$	■	$x_3$ -	$x_3$ -	$x_3$ -	$x_3$ +
$x_4$	■	$x_4$ -	$x_4$ +	$x_4$ -	$x_4$ -
$x_5$	■	$x_5$ +	$x_5$ -	$x_5$ -	$x_5$ -
		⇓	⇓	⇓	⇓
		$h_1$	$h_2$	$h_3$	$h_4$

- Break  $k$ -class problem into  $k$  binary problems and solve separately
- Combine predictions: evaluate all  $h$ 's, hope exactly one is + (otherwise, take highest confidence)
- Incorrect prediction if only one is wrong

## All-Pairs (Friedman; Hastie & Tibshirani)

		■ vs. ■					
$x_1$ ■	⇒	$x_1$ —			$x_1$ —		$x_1$ —
$x_2$ ■			$x_2$ —	$x_2$ +			$x_2$ +
$x_3$ ■				$x_3$ —	$x_3$ +	$x_3$ —	
$x_4$ ■		$x_4$ —			$x_4$ —		$x_4$ —
$x_5$ ■		$x_5$ +	$x_5$ +			$x_5$ +	
		⇓	⇓	⇓	⇓	⇓	⇓
		$h_1$	$h_2$	$h_3$	$h_4$	$h_5$	$h_6$

- One binary problem for each pair of classes
- Take class with most positives and least negatives
- Faster and more accurate than one-against-all

## Time Comparison

---

Assume training time is  $\mathcal{O}(m^\alpha)$  and test time is  $\mathcal{O}(c_t)$

	Training	Testing
OVA	$\mathcal{O}(km^\alpha)$	$\mathcal{O}(kc_t)$
All-pairs	$\mathcal{O}(k^2(\frac{m}{k})^\alpha)$	$\mathcal{O}(k^2c_t)$

## Time Comparison

---

Assume training time is  $\mathcal{O}(m^\alpha)$  and test time is  $\mathcal{O}(c_t)$

	Training	Testing
OVA	$\mathcal{O}(km^\alpha)$	$\mathcal{O}(kc_t)$
All-pairs	$\mathcal{O}(k^2(\frac{m}{k})^\alpha)$	$\mathcal{O}(k^2c_t)$

OVA better for testing time, all-pairs better for training. (All-pairs usually better for performance.)

## Error Correcting Output Codes (Dietterich & Bakiri)

---

- Reduce to binary using “coding” matrix

M	1	2	3	4	5
■	+	-	+	-	+
■	-	-	+	+	+
■	+	+	-	-	-
■	+	+	+	+	-

## Error Correcting Output Codes (Dietterich & Bakiri)

---

- Reduce to binary using “coding” matrix
- Train classifier for each bit

		1	2	3	4	5
$x_1$	■	$x_1$ -	$x_1$ -	$x_1$ +	$x_1$ +	$x_1$ +
$x_2$	■	$x_2$ +	$x_2$ +	$x_2$ -	$x_2$ -	$x_2$ -
$x_3$	■	$x_3$ +	$x_3$ +	$x_3$ +	$x_3$ +	$x_3$ -
$x_4$	■	$x_4$ -	$x_4$ -	$x_4$ +	$x_4$ +	$x_4$ +
$x_5$	■	$x_5$ +	$x_5$ -	$x_5$ +	$x_5$ -	$x_5$ +
	$\Rightarrow$	$\Downarrow$	$\Downarrow$	$\Downarrow$	$\Downarrow$	$\Downarrow$
		$h_1$	$h_2$	$h_3$	$h_4$	$h_5$

## Error Correcting Output Codes (Dietterich & Bakiri)

---

- Reduce to binary using “coding” matrix
- Train classifier for each bit

		1	2	3	4	5
$x_1$	■	$x_1$ -	$x_1$ -	$x_1$ +	$x_1$ +	$x_1$ +
$x_2$	■	$x_2$ +	$x_2$ +	$x_2$ -	$x_2$ -	$x_2$ -
$x_3$	■	$x_3$ +	$x_3$ +	$x_3$ +	$x_3$ +	$x_3$ -
$x_4$	■	$x_4$ -	$x_4$ -	$x_4$ +	$x_4$ +	$x_4$ +
$x_5$	■	$x_5$ +	$x_5$ -	$x_5$ +	$x_5$ -	$x_5$ +
		↓	↓	↓	↓	↓
		$h_1$	$h_2$	$h_3$	$h_4$	$h_5$

- Choose closest row of coding matrix to predict

## ECOC

---

- If rows of  $M$  are far apart, will be robust to error
- Much faster if  $k$  is large
- Disadvantage: binary problems may be unnatural

## That's it for classification!

---

- You can implement multiple forms of classification
- Derive theoretical bounds for many classification tasks
- Today is bridge to the future: classification foundation of other ML tasks
